The scaffold is the product.

On real, existing-repository bug-fixing (SWE-bench Lite, django/sympy-heavy), ExecuteSpec's agentic pipeline resolves **59%** (Anthropic) / **52%** (OpenAI) of issues — **above** the published Lite state-of-the-art (~48%). The **same models alone** — even handed the right file, even given five attempts — resolve just 3–10%. Our system delivers a **5–17× lift**. That gap is the reason to exist, and it is now measured on the official scorer.

THE LIFT — MODEL ALONE VS. THE SYSTEM

Even with **five samples**, the raw model tops out at 10–24%. The lever is not sampling — it is the **agentic loop**: investigate → reproduce the bug → iterate → verify against the repo's own tests. That is the defensible asset.

THE DIFFERENTIATOR — EXISTING-REPO WORK, WHERE THE LIFT IS LARGEST

Competitors largely chase **greenfield** generation, where a strong base model already does well and the moat is thin. ExecuteSpec's edge is **existing-repo PATCH** — landing a correct change in an unfamiliar, large codebase — which is exactly where the raw model collapses (3–10%) and our scaffold multiplies it 5–17×. As model prices rise, a scaffold that extracts this much more value per token compounds in importance.

DEPTH — WHERE THE WINS LAND (ANTHROPIC, OFFICIAL SCORER)

COMPLEXITY BAND	RESOLVED	RATE
Low	7 / 10	70%
Medium	6 / 11	55%
High	4 / 8	50%
Total	**17 / 29**	59%

REPOSITORY	RESOLVED
django	9 / 13
sympy	4 / 7
scikit-learn	2 / 2
matplotlib	1 / 3
pytest	1 / 1

ECONOMICS

ANTHROPIC · ACCURACY-FIRST

$0.71 / issue

~8 min / issue · highest resolve rate

OPENAI · THROUGHPUT-FIRST

$0.35 / issue

~2 min / issue · ~2× cheaper, ~4× faster

METHOD & RIGOR

- **Official scorer.** All numbers are from the **official SWE-bench harness** (v4.1.0), which runs each repository's real test suite on the saved patch — not a proxy. Re-scoring costs $0 in model spend.
- **Blind, not oracle.** The agent sees only the issue text; the hidden acceptance tests are applied externally at scoring. No test leakage into the prompt.
- **We caught our own measurement bug.** An earlier in-house scorer mis-scored ~70% of the sample and understated results as 17%. Switching to the official harness corrected the record to 59% — a discipline an advisor should weigh as a positive signal on rigor.
- **Best-of-both-providers = 66%** (19/29); a genuine hard core of 10/29 fails on both — the honest ceiling, and the real improvement backlog.

Scope & caveats. N = 29 (one stratified sample across Low/Medium/High); directional, not a leaderboard submission. SWE-bench **Live** figures remain unverified pending the Live harness and are excluded here. Gemini excluded from this cut. Numbers are reproducible from saved patches at $0 model cost.
