Launch Playbook

ExecuteSpec · founder reference · verified against code & migrations

2026-06-11 · RL-2026-06-019 / -020

01 WHERE YOU STAND

You are not lacking product — you're finishing a consistency-and-proof push.

TRACK	STATE
Public claims — pricing, compliance, capabilities	DONE truthful + unified everywhere (commit `1be342eb`)
UX wave 1 (review/11 defects)	DONE shipped + live-verified 375px/desktop (commit `26ab3f66`)
Trust-number bugs — score-on-Gradle · OpenRouter $0 cost · Stripe activation	IN FLIGHT the only engineering launch gates
Benchmarks	RE-RUNNING all public surfaces number-free until the rebuilt eval lands
Console-as-default chrome	YOUR CALL preview via the "Try Console ↗" status-bar button
Ops — prod URL, coupons, alerts, status page	CHECKLIST §7

The one-sentence thesis: **you built a trust machine; launch is the moment every surface says the same true thing about it.**

02 THE STORY

"AI that ships pull requests your team actually merges."

The frame: between copilots (you drive every keystroke) and full-autonomy agents (black box, surprise bills) sits **delegation with a contract** — approve the scope and the price up front, get back a PR with a receipt.

1 · Plan gate

Approve the plan and the price before a token is spent. Credits charge at approval, refund on failure.

2 · Verified score

Deterministic 0–100: code 30 · build 25 · your tests 20 · reviewer 20 · criticals 5. Never

3 · Your repos, your keys

Real PRs from your GitHub identity. BYOK with zero per-run markup.

self-rating. This is the brand.

Say: verified score · plan gate · spec · run · receipt · merge-able PR.
Don't say: SOC 2 (until certified) · trial (none exists) · Solo (retired — it's Pro) · ExecuteSpec-bot (PRs use the caller's PAT) · IDE jargon in marketing.

Lead: spec → plan gate → verified PR · the score · BYOK. **Support:** readymade library · autofix · project workbench. **Hide/beta:** benchmark dashboards · TB/SWE adapters · CLI + VS Code ("beta") · pause/resume · standards/contracts/ADRs (sell as Enterprise governance, don't demo).

03 PACKAGING — THE CANONICAL LADDER (MATCHES THE DB)

The metering sentence, verbatim on every surface: **"A run costs credits — 1 credit ≈ $5 of model spend — charged only when you approve the plan, refunded if the run fails."**

TIER	PRICE	INCLUDES	CAP
FREE	$0	15 runs/mo · small (1-credit) specs · 1 project · 1 repo · managed keys	$3/run
PRO	$29/mo · $289/yr (−17%) · ₹2,499	30 runs/mo · managed keys · PR review + code review (4 scans/mo) · 2 projects × 2 repos	$5/run — BYOK lifts it
TEAM	$39/seat/mo · ₹3,399 · from 1 seat · **monthly only**	BYOK, zero markup · unlimited runs · 5 projects · cross-repo · sharing · unlimited reviews · autofix	none (org spend caps + approval thresholds)
ENTERPRISE	custom	Team + MSA + signed DPA · model-matrix override + per-run pins · OpenRouter gateway · standards/contracts/ADRs · audit trail · repo allowlists	none

Facts that bite if forgotten: Pro is LISTED (V176; V185 retired only the "Solo" name) · Team yearly does not exist (V165) · top-ups expire in 90 days · no trial mechanics exist · **founder pricing = 50% off for life, first 100 Pro** (V177) — dormant until the Stripe coupon + Razorpay offer exist and a test purchase shows the discount. Enterprise hard rules (one-pager): never claim SAML end-to-end, SOC 2 complete, dedicated region, hard uptime SLA.

04 THE TRUTH PASS — WHAT CHANGED

SURFACE	WAS → NOW
`website/index.html`	Catalog-soup title → hero line · SOLO→PRO with DB-true bullets · "500 credits / $25 cap / 14d trial / never-expire / ExecuteSpec-bot / SOC 2 / SSO+SCIM / 99.9% SLA" removed · **all CTAs dev → app.executespec.ai**
`website/llms.txt`	Full rewrite (was $20 Pro · 5-run free · 2-seat min · "~80% score" · /v3/ routes)
App pricing page	3 hardcoded tiers (no Pro; fake "$31 yearly" Team) → 4 DB-true tiers + metering sentence
App trust page	SOC 2 "Ready" / pen-test rows → honest 8-layer story + "SOC 2 on the roadmap, ask us"
Legal (DPA/Terms)	SOC 2/ISO claims → true measures · "credits never expire" → cycle reset + top-up validity
`frontend/index.html`	No meta tags → full OG/twitter — shared verified reports now unfurl
Login panel	"BYOK bypasses the cost cap" → "Deterministic verified score on every PR"
SWE-bench brief	Marked **SUPERSEDED — do not quote** (old harness untracked the worker model)
PH kit	Rewritten current (tiers, additive score, honest hard-truths, asset status)

05 UX

Verdict (review/11 + your instinct): the screens are competently built — the **VS Code frame** and leaked internals are what feel bad. The web app's job is mission control, not editing.

Wave 1 shipped (26ab3f66), live-verified: enums humanized · relative timestamps (absolute on hover) · ⌘K off touch · OpenAI/OpenRouter casing · "Recommended (default)" · Production-vs-Prototype explainer · Pro cap $25→$5 · status-bar chip readable + 375px overflow fixed + "IDE · Beta" deleted · diff tints · first-run starter samples · PAT pre-flight · **verified score on the run-list wire** with 4-band badges (the score column previously read a field that never existed).

Pending decision — Console as default. Preview both: status bar → **Try Console** ⤴ (back: remove `es:console` from localStorage). On go: reframe Phases 2–4 — Home depth → mobile pass → flip default, retire the IDE shell (editor metaphor stays in run-result Code tabs + the VS Code extension). ≈ 1 focused week.

Wave-2 order: ① Console flip · ② notification spam (auto-read + digest; fresh accounts show "9+") · ③ typography split (mono = data, sans = prose) + ONE accent (kill coral-as-link) · ④ result-page action hierarchy + tab merge · ⑤ provider-first removal (rides the model-taxonomy rework, review docs 09/10).

06 PROOF POLICY (BENCHMARKS RE-RUNNING)

- **Quote no benchmark numbers anywhere** until the rebuilt-harness run lands — 59%/52% and the 7%→67% uplift are invalidated (LOW-complexity work silently ran the LIGHTWEIGHT tier, untracked).
- **Launch proof instead:** 5–10 real specs on known OSS repos → publish the shared verified-report links as a gallery. The report IS the demo; OG tags now make the links unfurl.
- **When new numbers land:** refresh the brief + banner; optional honest line in llms.txt + PH kit ("measured blind through the production pipeline, N=…, CI=…"). "Competitive", never "beats".

07 OPS BEFORE ANNOUNCING (GATES IN BOLD)

- **1 · Prod sells the right ladder** — `GET /api/billing/plans` on app.executespec.ai returns Free + Pro M/Y + Team M (both currencies); fix via `PUT /api/admin/tiers/{tier}`, never SQL.
- **2 · app.executespec.ai serves prod + signup works e2e** — all marketing CTAs point there; only then deploy `website/` (wrangler).
- **3 · The three trust-bug fixes land + re-verify** (fix sessions).
- 4 · Founder pricing live: coupon + offer + row + **test purchase shows 50%.**
- 5 · og-hero resolves on prod; a /shared link unfurls in Slack.
- 6 · Grafana alerts → Telegram bot; status page or explicit "email-only support" call.
- 7 · Demo video (script in PH kit §6) + report gallery.
- 8 · Non-blocking sweeps: pricing-analysis.md · tier-decision.md · press-kit README (pre-V176 numbers).

08 THE 14-DAY SEQUENCE

DAYS	WORK
1–2 (now)	Benchmarks re-run (you) · trust-bug fixes land (sessions) · Console decision (you — 10 min of clicking)
3–5	Wave-2 UX (Console flip if go) · ops §7 items 1–6 · founder pricing live
6–8	Demo video · OSS verified-report gallery · publish docs quickstart · deploy website
9–10	Soft launch: 10–20 design partners · white-glove · founder pricing · watch the funnel
11–14	Product Hunt / Show HN (kit is current) · reply cadence per PH kit §5

Measure with the existing 6-stage funnel: SIGNUP → PROJECT_CREATED → SPEC_SUBMITTED → PLAN_APPROVED → RUN_COMPLETE → PR_MERGED. The reframe's success metric is SPEC_SUBMITTED → PLAN_APPROVED.
